Sequence INT, Application US/08290665A

Batent No. 5882852

GENERAL INFORMATION:
APPLICANT: BURGH, J., MILLER, R.H. AND
APPLICANT: BURCELL, R.H.
TITLE OF INVENTION: NUCLEOTIDE AND DEDUCED
TITLE OF INVENTION: CORE GENES OF ISOLATES OF THE ENVELOPE 1 AND
TITLE OF INVENTION: CORE GENES OF ISOLATES OF HERATITIS C VIRUS
TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES
NUMBER OF SEQUENCES: 263
TITLE OF INVENTION: CORE GENES OF ISOLATES OF HEPATITIS C VIRUS TITLE OF INVENTION: AND THE USE OF REAGENTS DERIVED FROM THESE TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES NUMBER OF SEQUENCES: 263

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 11
JQ1584
genome polyprotein - hepatitis C virus (strain U.K.) (fragment)
N;Contains: core protein C; envelope protein E1; envelope protein E2; nonstructural prot
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Species: J7-Apr-1993 #sequence_revision 17-Apr-1993 #text_change 09-Jul-2004
C;Accession: JQ1584
C;Accession: JQ1584

N; Contains: core protein
C; Species: hepatitis C virus
A; Variety: genotype 1, N9
C; Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change
C; Accession: 841351
R; van Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.
submitted to the EMBL Data Library, January 1994
A; Description: Analysis of hepatitis C virus genotypes 1 to 5 by
A; Reference number: 841341
A; Residues: 1-115 < VAN>

S18031
Strong polyprotein - hepatitis C virus (isolate JK2) (fragment)
N;Contains: core protein; envelope protein 1; nonstructural protein 2; NS1/E2 protein
N;Contains: core protein; envelope protein 1; nonstructural protein 2; NS1/E2 protein
A;Variety: isolate JK2
C;Species: Appailits C virus
A;Variety: isolate JK2
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 09-Jul-2004
C;Accession: S18031

The present sequence represents an antigenic epitope from a hepatitis C virus (HCV) NS4 protein. The peptide comprises amino acids 1789-1867 of the HCV polyprotein. The specification describes antigenic epitopes from HCV core protein, NS3 protein, NS4 protein and NS4a protein. The antigenic peptides are useful as diagnostic reagents for detecting HCV in a biological sample. They are also useful for monitoring HCV infection in a patient sample in addition to diagnosis. Pharmaceutical compositions comprising the peptides are useful for preventing, minimizing or reducing HCV infection in patients who have been exposed to HCV or to individuals, such as health care workers or blood product recipients, who are more likely to become exposed to HCV infection. The antigenic peptides are also useful for generating antibodies which can be used to detect HCV proteins in a sample or for laboratory research purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New (mosaic) polypeptides, useful as reagents in assays for the diagnosis or monitoring of HCV infections and as components of anti-HCV vaccines, comprises antigenic groups of hepatitis C virus (HCV).

Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAR25854-74 are hepatitis C virus protiens. The genes encoding these proteins can each be used to prepare recombinant vectors by ligating the gene of interest in to a vector to be expressed in E. coli. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         76 SVVIVGRIILSGRPAVIPDREVLYQEFDEMEECASHLPYIEQGMQLAEQFKQKALGLLQT 135

The sequences given in AAR29852-70 are encodeed by various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention (see also AAR2660, AAR295559-60 and AAR29843-51). These RNA sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32578-79. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                        - used for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 SVVIVGRIILSGRPAVIPDREVLYQEFDEMEECASHLPYIEQGMQLAEQFKQKALGLLQT

These peptides were used in the preparation of novel antibodies. The antibodies were prepared by immunising a bird with one of the peptides and isolating the resulting antibody from the egg yolk of eggs laid by the immunised bird. The antibodies may be used in the detection of HCV antigens in the blood and are useful in the development of diagnostic agents or drugs for hepatitis C. The antibody is highly specific and as the peptide is injected without a carrier protein, only anti-NS3 or anti-NS4 antibodies are produced

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR29852-70 are encodeed by various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention (see also AAR29660, AAR295559-60 and AAR29843-51). These RNA sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32578-79. The sequences were then amplified using primer pairs. The CDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               237 SVVIVGRIILSGRPAVIPDREVLYQEFDEMEECASHLPYIEQGMQLAEQFKQKALGLLQT 296

```

```
The sequences given in AAR29852-70 are encodeed by various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C virus (HCV) gene of the invention (see also AAR29560, AAR29559-60 and AAR29843-11. Theses RNA sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32578-79. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)

    used for diagnosing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hayashi N;

The sequences given in AAR29660, AAR29559-60 and AAR29843-51 were encoded by clones which encode the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The NS2-NS4 RNA sequences were converted into cDNA using transcriptes in the presence of one of the primer sequences given in AAQ32553-64. The cDNA sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ3236. (Updated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hepatitis C virus gene and its encoded protein - used for diagnosing and vaccinating against hepatitis C virus infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20-APR-1992,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seki M,
 The sequences given in AAR29852-70 are encodeed by various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention (see also AAR29660, AAR29559-60 and AAR29843-51). These RNA sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into coNA using transcriptase in the presence of one of the primer sequences given in AAQ32578-79. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       587

                                                                      원
                                                                                                                                                                                                                                 8
                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR29852-70 are encodeed by various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention (see also AAR29560, AAR29555-60 and AAR29843-51). These RNA sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ35578-79. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these Clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                        16-DEC-1991
```

```
This sequence was encoded by the Hepatitis C Virus (HCV) gene of the invention. The HCV gene is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in an invitro screening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor polypeptide of HCV. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - used for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hayashi N;

The sequences given in AAR29660, AAR29559-60 and AAR29843-51 were encoded by clones which encode the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The NS2-NS4 RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32553-64. The cDNA sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                            AAQ81559 encodes AAK68864 hepatitis C virus (HCV) RNA helicase. The DNA was used in the construction of an expression vector, which was used to transform a baculovirus host. The transformed baculovirus could then be used for the recombinant prodn. of HCV RNA helicase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 SVVIVGRIILSGRPAVIPDREVLYQBFDEMEECASHLPYIEQGMQLAEQFKQKALGLLQT

```

```
The present sequence is a partial Hepatitis C Virus (HCV) polyprotein from the non-structral region. Partial proteinase sequences (AAR82692-93) are contained within this sequence. The proteinases can be used as anti-HCV agents. They can also be used to screen cpds. for their ability to inhibit their proteclytic activity. In this way proteinase inhibitors can be identified. (Updated on 16-OCT-2003 to standardise OS field)
                  An HCV proteinase active substance - which has activity as an anti-HCV agent and can be used to screen for proteinase inhibitors.
                                                                                                Disclosure; Page 39-48; 52pp; Japanese.

Sequence 11, Application US/09919901

Patent No. 659978

GREREAL INFORMATION:
APPLICANT: Potts, Karen B.
APPLICANT: Potts, Karen B.
APPLICANT: Potts, Karen B.
TITLE OF INVENTION: REPORTER GENE SYSTEM FOR USE IN CELL-BASED ASSESSMENT
TITLE OF INVENTION: OF INHIBITORS OF THE HEPATITIS C VIRUS PROTEASE
FILE REPRENCE: 0125-0005A
CURRENT FILING DATE: 2001-08-02
FRIOR PEPLING DATE: 1999-02-08-02
FRIOR PEPLING DATE: 1999-02-08-05
FRIOR PELING DATE: 1999-02-08-05
FRIOR PELING DATE: 1999-02-08-05
FRIOR PELING DATE: 1999-02-08-05
FRIOR PELING DATE: 1999-02-05-06-05
FRIOR PELING DATE: 1998-08-05
Sequence 4, Application US/09919901

Patent No. 6599738

GENERAL INFORMATION:
APPLICANT: Potts, Karen B.
APPLICANT: Potts, Karen B.
APPLICANT: Potts, Karen B.
APPLICANT: Potts, Raren B.
APPLICANT: Potts, Amy K.

Sequence 4, Application US/10191966

Patent No. 6790612

GENERAL INFORMATION.

APPLICANT: Potts, Amy K.

TITLE OF INVENTION: REPORTER GENE SYSTEM FOR USE IN CELL-BASED ASSESSMENT

TITLE OF INVENTION: OF INHIBITORS OF THE HEPATITIS C VIRUS PROTEASE

FILE REFERENCE: 0125-0005A

CURRENT APPLICATION NUMBER: US/10/191,966

CURRENT APPLICATION NUMBER: US/09/263,933

PRIOR APPLICATION NUMBER: US/09/263,933

PRIOR APPLICATION NUMBER: 09/129,611

PRIOR PILING DATE: 1999-03-08

PRIOR PILING DATE: 1999-03-08

Sequence 18, Application US/10191966

| Patent No. 6790612
| Patent No. 6790612
| GENERAL INPORMATION:
| APPLICANT: Potts, Karen E.
| APPLICANT: Potts, Amy K.
| TITLE OF INVENTION: REPORTER GENE SYSTEM FOR USE IN CELL-BASED ASSESSMENT ITLE OF INVENTION: OF INHIBITORS OF THE HEPATITIS C VIRUS PROTEASE CURRENT FILING DATE: 2002-07-10
| PRIOR APPLICATION NUMBER: US/10/191,966
| CURRENT APPLICATION NUMBER: US/09/263,933
| PRIOR FILING DATE: 1999-03-08
| PRIOR FILING DATE: 1999-03-08
| PRIOR FILING DATE: 1998-08-05
| NUMBER OF SEQ ID NOS: 33
| SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 958 SVVIVGRIILSGRPAIVPDRELLYQEFDEMEECASHLPYIEQGMQLAEQFKQKALGLLQT 1017
